

RABBIT REMEDY

**BASED ON A FORMULA
IN USE SINCE 1874.**

For treating all standard breeds raised commercially, as a hobby or for showing. Effective relief from symptoms caused by Snuffles, Pneumonia, Ear Mites or Ear Canker.

SNUFFLES AND PNEUMONIA

Symptoms -- Snuffles or colds produce sneezing, watery eyes, and a pus-filled nasal discharge. Watch for rabbits rubbing their noses with front feet. Check inside front paws of animals you suspect of having snuffles. Matted fur here can indicate snuffles. Rabbits with advanced snuffles will often have badly matted fur around the nostrils.

Frequently snuffles can develop into pneumonia because the same bacteria which cause snuffles can move down the respiratory passages into the lungs. Signs of pneumonia are difficulty in breathing and gasping.

Treatment -- Use VetRx Rabbit Remedy warm. To warm, open cap. Put bottle in small pan of water. Heat at medium temperature.

It is helpful in destroying any mites or mite ova which may be present.

GENERAL PRECAUTIONS

Of course, while you are treating infected animals, you will want to follow usual precautions. This is essential because snuffles and ear mites can be passed from rabbit to rabbit.

Isolate infected animals as soon as possible.

Clean all hutches and nest boxes which sick rabbits have occupied. Keep rabbits as clean and dry as possible. In case of snuffles, keep animals away from drafts. Cold symptoms in rabbits tend to subside and then recur. So, if your rabbits have a tendency to catch cold, watch them carefully for early symptoms.

Always test temperature of product before applying. Place 2 drops of warm VetRx on each side of nostrils, and to any scabbed area. Repeat two or three times per day until symptoms disappear. 8 drops per gallon in clean drinking water can help speed results in respiratory ailments.

Treating snuffles symptoms quickly with VetRx is one of the best ways to avoid colds that can develop into pneumonia.

EAR MITES OR EAR CANKER

Symptoms -- Rabbit will shake its head a great deal and scratch at its ears. Brown, scaly scabs appear inside ears. Ear Mites and Ear Canker are two names for the same condition. Symptoms are caused by tiny mites which burrow into skin of the ear and cause tissue damage. Check your rabbits' ears routinely for symptoms.

Treatment -- Use VetRx warm. Shake bottle well to help mix contents.

Apply by the drop or with a Q-Tip swab. Be sure to dampen entire affected area. Do not dig off the scabs. The scab should eventually be shaken off by the rabbit.

After 24 hours, dampen entire affected area for the second time. Repeat again after 36 hours. Wait three more days and add two drops into ears. This should result in clean mite-free ears.

If, at this time, scabs have not shaken off by the rabbit, use a damp Q-Tip and gently remove remaining scales and crust from ear.

Note: VetRx will leave an oily film on skin and fur. This will not burn the skin or remove hair.

When a rabbit has been to a show, it is wise to isolate it from the others for several days. Treat ears and nose as described above, just as a precaution.

A WORD ABOUT 4-H RABBIT BREEDERS

VetRx Rabbit Remedy is ideal for use by children who raise rabbits. It is safe to use, easy to apply.

CAUTION

For animal use only. Not for human consumption. Use only as directed. Keep this and all medication out of the reach of children.
